

**Helps Maintain Lush Healthy
Lawn longer throughout Season**

SC 1200

**CHELATED
Nitrogen / Iron / Manganese
TURF Mix**

GENERAL INFORMATION:

SC 1200 is designed for soil and/or foliar application, to provide and correct pre-existing Nitrogen Manganese, Iron deficiencies as indicated by plant leaf and soil testing. The ingredients in **SC 1200** are 100% water soluble and chelated.

Research has shown the plants can assimilate Micro nutrients better via foliar application than if the Micro nutrients were applied to the soil. The response is quicker and seems to be more effective. Even if you have micro Nutrients added in your granular NPK mix, you will not be getting the maximum benefits from them and essentially wasting money.

It would be recommended when applying in the soil to add our DEEP ROOT concentrate to help buffer irregular soil pH, so the **SC 1200** work faster and be last longer.

We use SUGAR BASED chelating compounds to make **SC 1200** more Effective and Last Longer. **DARK GREEN** contains no EDTA chelates. The advantage of using SUGAR (organic) chelates over EDTA chelates are:

**EDTA chelate will pick up or lock other elements in the soil causing them to be unavailable to the soil.*

**EDTA chelates are synthetic and contains no nutrient value and is not recognized as Organic.*

**Organic chelates provides the plants with a sugar source after it has finished it's job making the micro nutrient more available.*

**Organic chelates do a better job as a chelate compared to synthetic chelates.*

**Organic Chelates will allow the nutrient to last longer.*

**When adding to other products a jar compatibility test is always recommended.
NEVER MIX CONCENTRATES TOGETHER. ALWAYS PLACE WATER IN TANK FIRST THEN ADD
CONCENTRATES, WHILE MIXING.
IRON WILL STAIN.**

Available in 2.5 gallon, 5 gallon, 55 gallon containers and 275 mini bulks.
